

Technical Note

4. Technical note

You need to submit a **one-page explanation**.

You can use this directly:

Technical Note – Responsive University Event Registration Portal

CSS Methods Used:

The project demonstrates inline, internal and external CSS. Inline CSS is used for a small registration message, internal CSS is used for the hero message, and external CSS is used for the main website design. External CSS is most suitable for a multi-page website because one stylesheet can control the design of multiple HTML pages consistently and makes maintenance easier.

Selectors Used:

The stylesheet uses element, class, ID, group, descendant, child, attribute, pseudo-class and pseudo-element selectors. Hover and focus states are also implemented for navigation links, buttons and form controls.

Layout Method:

CSS Grid is used for the event catalogue, while Flexbox is used for the header, hero section and event statistics. Four event cards are displayed in columns on desktop screens and change to a single-column layout on smaller screens.

Positioning:

Sticky positioning is used for the navigation header. Absolute positioning is used for the event-status badges. A fixed-position help button is placed at the bottom-right corner. z-index is used to control the stacking order.

Responsive Behaviour:

Media queries are used at different screen widths. On mobile screens around 375px, the event cards, registration form and footer change to a single-column layout. The navigation also wraps to prevent horizontal scrolling.

Visual Properties:

The design uses gradients, border-radius, box-shadow, text-shadow, opacity, transitions, transforms, cursor and overflow properties. Hover and focus effects improve interaction and accessibility.

Testing:

The webpage was tested on desktop and mobile viewport sizes. Navigation,

event cards, buttons and form controls were checked for proper alignment and readability.

5. Width calculation

the calculation for **one event card**.

Your card has:

Content width = 250 px

Left padding = 24 px

Right padding = 24 px

Left border = 2 px

Right border = 2 px

Default content-box calculation:

Total width

= Content width

+ Left padding

+ Right padding

+ Left border

+ Right border

= 250 + 24 + 24 + 2 + 2

= 302 px

Answer:

Total horizontal width = 302 px

With:

box-sizing: border-box;

if the declared width is 250px, the padding and border are included inside that 250px.

6. Two-browser testing 🌐

Test the webpage in at least two open-source browsers.

Use:

Browser 1

Mozilla Firefox

Browser 2

Chromium

Open your index.html in Firefox and check:

- Navigation
- Event cards
- Buttons
- Registration form
- Footer
- Mobile layout

7. Two layout issues + corrections 🛠️

The assessment specifically asks you to **record two issues found during testing and how you corrected them.**

I can use realistic issues from my responsive testing.

Issue 1 – Event cards

Problem:

On a smaller screen, four event cards were displayed in multiple columns and the content became difficult to read.

Correction:

A media query was added to change the event grid to one column:

```
@media screen and (max-width: 650px) {
```

```
.event-grid {  
    grid-template-columns: 1 fr;  
}  
}
```

Issue 2 – Registration form

Problem:

The two-column registration form became too narrow on mobile screens.

Correction:

The form rows were changed to one column:

```
@media screen and (max-width: 650px) {  
    .form-row {  
        grid-template-columns: 1 fr;  
    }  
}
```

8. Final submission folder

Create a folder like this:

University-Event-Portal
